

The ditaa package

Hiroshi Ukai

2018/10/18

The L^AT_EX ditaa package renders your ascii art inside your LaTeX files into pretty image files which you can use them in your papers.

Usage:

To usepackage **ditaa**, typically do following.

```
\def\imagepath{./resources}
\usepackage[imagepath=\imagepath]{ditaa}
\graphicspath{ {\imagepath/} }
```

A variable `\imagepath` points a directory that your images reside. Under it, you need to create a directory `ditaa` in advance. In this directory, `ditaa` environment creates its working files.

Features:

This is a ditaa diagram example.

```
\begin{ditaa}[8cm]{ditaa caption example}{ditaaexample}
+-----+ +-----+ +-----+
|        | --+ ditaa +--> |        | | |
| Text   | +-----+ |diagram|
|Document|  !!magic!!  |        |
|   {d}  | |        | |        |
+-----+ +-----+ +-----+
      :                               ^
      |      Lots of work           |
      +-----+
\end{ditaa}
```

The fragment above will be rendered into following diagram.

Figure 1: ditaa caption example

And you can specify image width like this Figure.2.

```
\begin{ditaa}[6cm]{ditaa caption example2}{ditaaexample2}
+-----+
|  cBLU  |
|        |
|   +----+
|   |cPNK|
|   |    |
+-----+
\end{ditaa}
```

To denote your diagram, you can do

```
Figure~\ref{fig:ditaaexample2}
```

, where `ditaaexample2` is the second argument you gave to the `ditaa` environment as you see above. The prefix `fig:` is given by `ditaa` environment automatically.

Figure 2: ditaa caption example2

Enjoy!

ChangeLog:

0.9 – Preparation for first ditaa release.
