1 MAC OSX and BSD port

On the MAC OSX the signal `[[SIGCLD]]` has been renamed to `[[SIGCHLD]]`. In order to handle this change we need to ensure that the platform variable is set properly and that the platform variable is changed everywhere.

— mac os signal rename —

```
#if defined(MACOSXplatform) || defined(BSDplatform)
    bsdSignal(SIGCHLD, null_fnct, RestartSystemCalls);
#else
    bsdSignal(SIGCLD, null_fnct, RestartSystemCalls);
#endif
```

2 License

*/
```

The MACOSX platform is broken because no matter what you do it seems to include files from `[[/usr/include/sys]]` ahead of `[[/usr/include]]`. On linux systems these files include themselves which causes an infinite regression of includes that fails. GCC gracefully steps over that problem but the build fails anyway. On MACOSX the `[[/usr/include/sys]]` versions of files are badly broken with respect to the `[[/usr/include]]` versions.

```
